

CLAIMS

1. A scanning electron microscope system including an electron energy analyzer, comprising:

a primary electron beam column for forming a primary electron beam and focusing it onto the specimen, the primary electron beam column including a high resolution objective lens that immerses the sample in a magnetic field; and

a secondary electron optical system for collecting secondary electrons through the high resolution objective lens, the secondary electron system including:

a lens creating an accelerating field for accelerating secondary electrons through the high resolution objective lens;

an electrostatic capacitor for deflecting the secondary electrons from the path of the primary beam;

a shield extending substantially through the electrostatic capacitor and shielding the primary beam from deflection and aberrations caused by the electrostatic capacitor, the shield being conductive on the inside to shield the primary beam and having on the outside a potential gradient to create an external electric field related to the electric field of the electrostatic capacitor, thereby reducing distortion of the field of the spherical capacitor caused by the shield; and

an electron energy analyzer for determining the energy of the secondary electrons.

2. The scanning electron microscope of claim 1 in which the electrostatic capacitor comprises a spherical capacitor.

3. The scanning electron microscope of claim 1 in which the shield comprises a tube or polygon.

0040556-04301

4. The scanning electron microscope of claim 1 in which the shield comprises a pair of or multiple plates.
5. The scanning electron microscope of claim 1 in which the high resolution lens comprises a snorkel lens.
6. The scanning electron microscope of claim 1 in which the high resolution lens comprises a double pole magnetic lens.
7. The scanning electron microscope of claim 1 further comprising a transfer lens for adapting the output of the spherical capacitor to the input of the electron energy analyzer.
8. A scanning electron microscope system including an electron energy analyzer, comprising:
 - a primary electron beam column for forming a primary electron beam and scanning the beam across a specimen surface to cause the emission from the specimen of secondary electrons, the primary electron beam column including a high resolution objective lens; and
 - a secondary electron optical system for collecting the secondary electrons through the objective lens, the secondary electron system including a deflector for deflecting the secondary electrons from the path of the primary beam without significantly degrading the resolution of the primary beam.
9. The scanning electron microscope system of claim 8 in which the deflector produces a field for deflecting the secondary electrons and further comprising a shield that shields the primary beam from the field.

a lower magnetic pole piece having a magnetic field generating coil, wherein the dual pole magnetic lens disposed in the first lens assembly focuses the primary electron beam and

creating a beam of primary electrons;

forming an image of the virtual Auger source off the path of the primary beam; and

27. The method of claim 26 in which forming an image of the virtual Auger source includes using an electrostatic capacitor to form an image of the Auger source.

28. The method of claim 26 in which directing a beam of primary electrons through an objective lens toward a specimen surface includes directing the primary electrons through a shield to reduce aberration of the beam by fields used to form the image of the Auger electron source.

1. The first part of the report, "Introduction", discusses the importance of the study and the objectives of the research. It also provides a brief overview of the methodology used in the study.

2. The second part of the report, "Literature Review", discusses the existing literature on the topic. It identifies the gaps in the literature and provides a summary of the findings of previous studies.

3. The third part of the report, "Methodology", describes the research design, the sample, and the data collection methods. It also discusses the statistical methods used in the analysis.

4. The fourth part of the report, "Results", presents the findings of the study. It includes a summary of the descriptive statistics, the results of the hypothesis tests, and the results of the regression analysis.

5. The fifth part of the report, "Conclusion", summarizes the main findings of the study and discusses the implications for future research. It also provides a brief discussion of the limitations of the study.
